

description

feasibility study and final project for the conversion of a building from a commercial to a residential one with demolition and reconstruction

client

MAST srl

The project involved the transformation of a building located in via Segantini in Bologna from its current use as office space into a residential building through demolition and reconstruction.

The proposed project was to build a residential building with an underground garage, maintaining the original corner position on the street front that gives the building a peculiar urban value as a hinge element.

The intent was that this building take on the role of signaling a shift in urban scale between the smaller structures of the residential fabric of the single and two-family buildings on the lot, and the construction of larger apartment buildings, and functional buildings such as the local school.
